Abstract— This research investigates the significance of communication skills in education-based counseling and their impact on students' decision-making processes and levels of involvement. However, with the exponential rise of EdTech platforms and private educational institutions, effective counseling is becoming quintessential as students are bombarded with academic options. They are the first point of contact with prospective and new students, helping them in identifying suitable educational programs. A well-rounded understanding of the above is best exemplified in communication skills such as active listening, clarity in explanation, empathy and feedback (constructive). This study is a descriptive research design and collecting primary data by using structured questionnaires distributed to students in the selected universities, which includes admission counselors. It collects secondary data from journals and verified web pages. Results showed that effective communication skills are an important factor in developing rapport with students during the counseling process which enhances student trust, satisfaction and confidence. In summary, the study highlighted that institutions must develop counselors' communication competencies to get better student involvement and effectively provide educational counseling.

Keywords— Communication Skills, Educational Counseling, Student Guidance, EdTech Platforms, Student Engagement.

I. INTRODUCTION

The education industry has rapidly evolved with the rise of online learning websites, EdTech firms and private academies in recent years. That is because they have a range of academic programs and career options, which often leads to confusion while taking the decision. Educational counseling assists students in understanding numerous obtainable options as well as leading them to appropriate

education programs. The importance of effective communication in counseling. Counselors are required to clarify course structures, career opportunities, admission processes and institutional policies. At the same time, they also need to listen to students' concerns and give guidance with both empathy and clarity. Communicating poorly can result in miscommunication, decreased trust and poor decision making. Hence, communication competency is crucial in determining the counseling process to be effective as well as developing strong relationships and how they can help educational institutions in their recruiting efforts.

II. OBJECTIVES OF THE STUDY :

The main objectives of this study are:

1. To examine the role of communication skills in educational counseling.
2. To analyze how effective communication influences student trust and engagement.
3. To study the impact of communication skills on student satisfaction and decision-making during counseling.

III. LITERATURE REVIEW

1. This research contributes significantly to the discourse regarding educational counselling. This article provides valuable information for those responsible for developing counselling education programs. It also illustrates the importance of developing counselling knowledge and skills

- through practicum learning experiences while at the same time having an awareness of and being respectful toward other cultures. Future research may further develop and support these concepts; however, this article is a useful resource for understanding both the opportunities and obstacles involved in preparing university students to develop counselling skills.
2. Communication abilities are the foundation of effective student support and educational advice. Research done before was limited to active listening and empathy when attempting to establish trust with students by allowing them to tell their stories. This original research then developed into a broader focus by examining both verbal and non-verbal methods of communication, including the effectiveness of using open-ended questioning and positive body language to help develop the student's ability to self-reflect and make choices. More recent research has focused on how powerful, clear and empathetic dialogue can assist students in coping with their academic pressures from school, career paths, and mental health issues. All published articles on this subject have shown that a communication skill set is essential for providing appropriate and supportive guidance to students while also addressing future requirements for creating culturally relevant and technically flexible student supports.
 3. Overall, this study offers valuable insights into the development of communication abilities among students. It focuses on the importance of reflection and learning experiences in developing effective communication skills in an educational environment. The findings indicate that students can benefit from being encouraged to evaluate and reflect on their communication skills to increase their effectiveness in interacting with others. This study is relevant to educators and researchers interested in developing effective communication skills in academic environments. Although the study was based on exploratory research, its findings are relevant to the development of effective communication skills in academic environments.
 4. The process of learning through a simulation-based learning process is very significant in developing communication and counseling skills in clinical education, thus creating a situation where it is possible for students to develop confidence in dealing with patients and enhancing professionalism through successful interactions. This research would be very useful for those in charge of developing clinical education, and it further adds to the body of literature that is required for more research to be conducted on best practices.
 5. The present research article illustrates the influence of emotional intelligence on the development of communications in adolescents empirically. It gives a glimpse of the relationship between emotion/psychological theory and practical/educational issues, as well as the combined effect of emotional intelligence, social anxiety, and social communication skills. Further studies should be conducted in different school systems. Nevertheless, the article justifies the rationale behind enhancing the mental well-being of adolescents.
 6. The research done by Judith Wang et al. shows that there is a link between metacognitive capacity and students' success in nursing school in terms of academic and clinical activities. When students are more metacognitively aware, they tend to excel in these activities, especially if they also perceive the school environment to be favorable. According to the research done by Y. Chen, communication skills are very vital in nursing school, and having excellent communication skills contributes immensely to the competency of a nursing student. The findings from these two pieces of research can be used to conclude that reflective thinking and good communication skills are vital in the preparation of nursing students to practice nursing as a profession.
 7. The purpose of the study was to assess the impact of reality group counseling in the reduction of communication anxiety amongst counseling students. Based on evidence, it has been established that counseling students experience some form of nervousness and/or anxiety in the act of giving their opinions in a public forum, which in turn affects their academic performance and consequently their development as future counseling professionals. Through reality-based group therapy, the students were given the opportunity to share their experiences, think and/or consider their behavior, and develop self-confidence in the ability to effectively interact with others. Based on the evidence obtained in the current study, it was established that reality group counseling was effective in the reduction of communication anxiety, and as a result, the students would be comfortable in class discussions and would be able to freely express their opinions in a public forum, thereby proving that reality group-based counseling could be effective in the education sector.
 8. Educators, counselors, and policy makers will find this to be an excellent resource as it provides a compendium of research evidence that suggests that group guidance services result in the development of social skills in young children, and it also emphasizes the need for the facilitation of group or individual counseling sessions by the school counselor. This article contributes to the existing body of knowledge concerning the influence of socialemotional learning in elementary schools, provides a base for the theory as well as the practice of guidance and counseling in the elementary schools, and enhances the ability of students to communicate effectively with other individuals.
 9. Inter Professional Education (IPE) is now seen as an important way to work together with other professionals and improve our ability to communicate and understand our different professions. Holman, Wison and Russell (2025) looked at how to use a competency-based approach to IPE for graduate students in special education & speech language pathology programs. The researchers found that productive academic tasks and collaborative problem-solving experiences are highly beneficial for building the students' collaboration skills. This aligns with the existing

literature regarding how competency-based training supports student preparation for complex, teambased work settings. Furthermore, these findings also support the fact that cross-disciplinary (IPE) learning helps students develop their communication skills and provide increased confidence to promote their career involvement; thus, developing the importance of using a competency-based approach for IPE within the professional development of an individual.

10. Many recent findings indicate strong evidence for the importance of communication within educational counselling; specifically, communication's contribution to building trust and a psychological sense of safety in the relationship between the counsellor and student. Zheng, Feng and Wang (2025) report that the degree of discourse relevance, the level of professional competence, and the decisions made in regard to the channel of communication all significantly impact the effectiveness of the counselling process. Trust also mediates and moderates the quality of the outcomes. Many of the same previous studies also demonstrate the value of verbal and non-verbal methods, such as reflective responses and supportive body language, as enhancing both student self-awareness and making satisfactory decisions. This focus on communication is also being explored in the context of digital counselling, where there is now a recognized need for better methods of building empathy and clarity in online communication. The literature all together demonstrates that communication skills play an essential role in providing effective guidance to students and indicates that there are significant gaps in the current understanding of what constitutes reciprocal communication with students and in the effective adaptation of the strategies used for traditional forms of communication to their use with virtual platforms.

IV. RESEARCH METHODOLOGY

To collect primary data, structured questionnaires were provided to both students and educational counselors at educational institutions and EdTech platforms. The questions on the questionnaire were focused on communication, including clarity of messages, listening skills, empathy and providing feedback during educational counseling sessions. Secondary data was obtained from scientific journals, research papers and credible websites that are related to the role of effective communication skills in educational counseling. A descriptive analysis was used to analyze the data collected to determine the relationship between effective communication skills and student participation in education counseling as well as the effectiveness of educational counseling.

Results and Discussion

According to the results of the research, effective counsellors utilize a range of communication skills

such as providing emotional support through listening and then, as needed, clearly explaining their position, in order to build a sense of trust between themselves and the student. This trust enables the student to have an opportunity to share information regarding their academic path and career aspirations. In addition to the trust between the student and the counsellor, effective communication has an impact on the student's level of confidence will in deciding on an academic program. Higher levels of student satisfaction and improved recruitment efforts for those institutions providing counselling training from a communication stand point are evident.

Figures and Tables

Data in Fig. 1 present the percentage of individuals with anxiety disorder, depression, suicidal thoughts, and academic distress between the years of 2015-2016 to 2020-2021. The most common mental health concern during this timeframe is depression; it has gone from around 25% prevalence to over 40%. The second most frequent form is anxiety; it has gone from being present in 21% of participants to 34%. Academic distress has also shown growth; by the year 2020-2021, it had increased to just under 27%. Suicidal thoughts have shown the least percentage increase but did fluctuate over the years of this study. Collectively, these trends demonstrate a marked increase in mental health issues, which reinforces the importance of providing effective interventions.

Figure 2 shows the number of articles published on an annual basis from 2010 to 2022. There have been considerable fluctuations from year to year, with almost no or very few articles published during the years of 2013, 2014 and 2016; however, the highest number of articles were published in 2011, 2015, 2018 and 2021. Most recently, despite the fluctuations there has been an overall upwards trend of increasing number of publications over time. This indicates an increase in interest of researchers in the field of study.

CONCLUSION

Counselors' ability to communicate effectively – through empathetic listening, articulating ideas clearly, and interacting in an honest manner – enhances students' experiences in counseling by creating a supportive environment where they can comfortably discuss their academic and professional aspirations with their counselor. Students develop a strong relationship of trust with their counselor due to effective communication; thus developing the student's confidence in selecting academic programs. Institutions that provide extensive training for counselors on how to communicate effectively to students generate higher student satisfaction rates and greater-than-average enrollment.
